The Lie Algebra of Smooth Sections of a T-bundle

M. Nadjafikhah and H. R. Salimi Moghaddam

Abstract: In this article, we generalize the concept of the Lie algebra of vector fields to the set of smooth sections of a T-bundle which is by definition a canonical generalization of the concept of a tangent bundle. We define a Lie bracket multiplication on this set so that it becomes a Lie algebra. In the particular case of tangent bundles this Lie algebra coincides with the Lie algebra of vector fields.

Keywords: Vector bundle, Lie theory

1. Introduction

We know that if M is a smooth manifold, then \( \chi(M) \), the set of all smooth vector fields on M (or, the set of all smooth sections of \( \chi(M) \) forms a Lie algebra. (See for example [2]). In this paper first we define the concept of a T-bundle, which is a generalization of tangent bundle. Then, we define a Lie algebra structure on the set of all smooth sections of a T-bundle such that in the particular case of tangent bundle, it coincides with the Lie algebra of vector field. We are able to generalize many of definitions and theorems about vector fields to the set of smooth sections of T-bundles.

2. T-bundle

2.1. Definition

Let E and M be smooth manifolds with dimensions \( n+k \) and \( n \) respectively, such that \( k = b \cdot n \) for some \( b \in \mathbb{N} \). Also suppose that \( p:E \rightarrow M \) is a smooth map. By a T-chart on \( (E, p, M) \) we mean an ordered pair \( (U, \psi) \) where \( U \) is the domain of a chart \( (U, u) \) in \( M \) and \( \psi \) is a fiber respecting diffeomorphism as in the following diagram,

\[
\begin{array}{ccc}
E \mid U := p^{-1}(U) & \xrightarrow{\psi} & U \times \mathbb{R}^k \\
p & & pr_i \\
U & & \\
\end{array}
\]

where \( pr_i \) is the projection on the first component. Two T-chart \( (U_{\alpha}, \psi_{\alpha}) \) and \( (U_{\beta}, \psi_{\beta}) \) are called TM-compatible

\[
\forall x \in U_{\alpha\beta} := U_{\alpha} \cap U_{\beta}, \forall y \in \mathbb{R}^k; \\
(\psi_{\alpha} \circ \psi_{\beta}^{-1})(x, y) = (x, \psi_{\alpha \beta}(x) y)
\]

For some mapping \( \psi_{\alpha \beta} : U_{\alpha \beta} \rightarrow GL(k, \mathbb{R}) \) by

\[
\begin{bmatrix}
J_{\alpha \beta}(x) & 0 & 0 \\
0 & J_{\alpha \beta}(x) & L \\
M & M & M \\
0 & 0 & L & J_{\alpha \beta}(x)
\end{bmatrix}
\]

Where \( J_{\alpha \beta}(x) = \left[ \frac{\partial u_{\alpha}^j}{\partial u_{\beta}^i}(x) \right] \). The mapping \( \psi_{\alpha \beta} \) is called the transition function between the two T-charts.

2.2. Definition

A T-atlas \( A = (U_{\alpha}, \psi_{\alpha}) \) for \( (E, p, M) \) is a set of pair-wise TM-compatible T-charts \( (U_{\alpha}, \psi_{\alpha}) \) such that \( (U_{\alpha})_{\alpha \in \mathcal{A}} \) is an open cover of \( M \). Two T-atlas are called equivalent, if their union is again a T-atlas.

2.3. Definition

A T-bundle \( (E, p, M) \) consists of two manifolds E (the total space) and M (the base) and a smooth mapping \( p : E \rightarrow M \) (the projection) together with an equivalence class of T-atlas.

2.4. Lemma

Let \( (E, p, M) \) be a T-bundle. Then for any \( x \in M \) there is a unique vector space structure on fiber \( E_x := p^{-1}(x) \) which is isomorphic with \( \mathbb{R}^k \).
Proof: Let \((U_\alpha, \Psi_\alpha)\) and \((U_\beta, \Psi_\beta)\) be two T-charts with \(x \in U_{\alpha\beta}\), then we have

\[
\Psi_\alpha \left|_{\xi_x} \right.: E_x = \{ x \} \times R^k
\]

\[
\xi_x, a \mapsto (x, h_\alpha(\xi_x))
\]

and

\[
\Psi_\beta \left|_{\xi_x} \right.: E_x = \{ x \} \times R^k
\]

\[
\xi_x, b \mapsto (x, h_\beta(\xi_x))
\]

Therefore, \(h_\alpha(\xi_x) = h_\beta(\xi_x)\). Also, we have

\[
\Psi_\alpha(\Psi_\beta^{-1}(x,v)) = (x, h_\alpha(\Psi_\beta^{-1}(x,v)))
\]

(4)

or \(\Psi_{\alpha\beta}(x,v) = h_\alpha(\Psi_\beta^{-1}(x,v))\); also, we have

\[
(x, h_\beta(\Psi_\beta^{-1}(x,v))) = \Psi_\beta(\Psi_\beta^{-1}(x,v)) = (x,v)
\]

(5)

And therefore \(h_\beta(\Psi_\beta^{-1}(x,v)) = v\). Therefore,

\[
\Psi_{\alpha\beta}^{-1}(x,v) = h_\alpha(\Psi_\beta^{-1}(x,v))
\]

(6)

In other words, \(\Psi_{\alpha\beta}(x).h_\beta(\xi_x) = h_\alpha(\xi_x)\). We know also that \(\Psi_{\alpha\beta} \in GL(k,R)\) and therefore \(E_x\) has a unique vector space structure.

2.5. Corollary

Let \(\{e_1, K, e_2\}\) be the standard bases for the vector space \(R^k\), then \(\{\Psi_\alpha^{-1}(x,e_1), \ldots, \Psi_\alpha^{-1}(x,e_k)\}\) and \(\{\Psi_\beta^{-1}(x,e_1), \ldots, \Psi_\beta^{-1}(x,e_k)\}\) are two ordered bases for \(E_x\). Let

\[
\xi_x = \sum_{i=1}^k y_i \Psi_\alpha^{-1}(x,e_i) = \sum_{i=1}^k z_i \Psi_\beta^{-1}(x,e_i)
\]

(7)

that \(y_i, z_i \in R\) then

\[
\begin{bmatrix}
y_1 \\
y_2 \\
y_k
\end{bmatrix} = \Psi_{\alpha\beta}(x),
\begin{bmatrix}
z_1 \\
z_2 \\
z_k
\end{bmatrix}
\]

(8)

2.6. Theorem

Any T-bundle admits a vector bundle structure but the inverse is not correct.

Proof: The first part of theorem is trivial, for this it is sufficient to notice that any T-atlas is a vector bundle atlas. Therefore, if \(A\) is a maximal T-atlas on \(E\) then there is a maximal vector bundle atlas \(A'\) such that \(A \subseteq A'\).

The following example proves the second part of theorem. Let \(E = J^2(R,R)\) be the vector bundle of jet's of second order from \(R\) to \(R\) at 0, that \(p : E \to R\) is the natural projection. Consider the following two compatible charts for \(R\):

\[
u_1 : U_1 := R \to R, \quad t \mapsto t(0.1)
\]

\[
u_2 : U_2 := R \to (0, +\infty), \quad t \mapsto e^{2t}
\]

Then, \(A = \{U_1, U_2\}\) is an atlas for standard structure of \(R\). Consider the two mappings

\[
\Psi_1 : p^{-1}(U_1) \to U_1 \times R^2
\]

\[
(f_1(x,y,z) = (x,y,z)
\]

(10)

\[
\Psi_2 : p^{-1}(U_2) \to U_2 \times R^2
\]

\[
(f_2(x,y,z) = (x;2e^{2x}y,e^{2x}y+2e^{2x}z)
\]

(11)

It is clear that \(\{U_1, \Psi_1\}\) and \(\{U_2, \Psi_2\}\) are two vector bundle charts such that \(\Psi_2 \circ \Psi_1^{-1}(x,y,z) = (x;2\Psi_2(\Psi_1(x))(y,z))\), where

\[
\begin{bmatrix}
y \\
z
\end{bmatrix} \mapsto \begin{bmatrix}
2e^{2x} & 0 \\
e^{2x} & 2e^{2x}
\end{bmatrix} \begin{bmatrix}
y \\
z
\end{bmatrix}
\]

(12)

But \(J^2(x) = [2e^{2x}]\). Therefore, \(E\) is a vector bundle but is not a T-bundle.

2.7. Definition

Let \((E, p, M)\) and \((F, q, N)\) be two T-bundles. By a T-bundle homomorphism we mean a pair \((\phi, \varphi)\) of smooth maps \(\phi : E \to F\) and \(\varphi : M \to N\) such that \(\phi : E \to F\) is fiberwise linear and the following diagram is commutative:

\[
\begin{array}{ccc}
E & \xrightarrow{\phi} & F \\
\downarrow{\Phi} & & \downarrow{\Phi} \\
M & \xrightarrow{\Phi} & N
\end{array}
\]

Therefore, for any \(x \in M\) the map \(\phi_x : E_x \to F_{\varphi(x)}\) is linear. In this case we say that \(\phi\) covers \(\varphi\). If \(\phi\) is invertible then we say \(\phi\) is an isomorphism. T-bundles
together with their homomorphisms form a category $\mathcal{TVB}$.

3. The Lie Algebra of Smooth Sections of a T-bundle

3.1. Definition

Let $x$ be a point in $M$. We define

$$
\bigoplus_{i=1}^{b} T^i M := \bigoplus_{i=1}^{b} T^i_x M
$$

(13)

where for any $i = 1, ..., b$, $T^i_x M$ is the tangent space at $x$, for distinction, the index $i$ is attributed. Also we define

$$
\bigoplus_{i=1}^{b} T^i M := \bigoplus_{i=1}^{b} T^i M
$$

(14)

as a manifold is diffeomorphic to Whitney-sum of $b$ copies of $T^i M$ (see [1]). In other words,

$$
\bigoplus_{i=1}^{b} T^i M = \{(v_i, L, v_h) \mid v_i \in TM, \forall i, j : \pi(v_i) = \pi(v_j)\}
$$

(15)

The projection is defined naturally.

3.2. Theorem

$(\bigoplus_{i=1}^{b} T^i M, \pi, M)$ is a T-bundle.

Proof: Let $(U, u)$ be a chart on $M$, it is sufficient to define the map $\psi : \pi^{-1}(U) \to U \times R^k$ by

$$
\left( \sum_{i=1}^{n} a_i^j \frac{\partial}{\partial u^i}(x), L, \sum_{i=1}^{n} a_h^j \frac{\partial}{\partial u^i}(x) \right)_{\alpha}
$$

(16)

(x : a_i^j, L, a_h^j)

3.3. Definition

Let $(E, p, M)$ be a T-bundle with T-atlas $(U_{\alpha}, \psi_{\alpha})_{\text{ad}}$. Assume $x$ be in $M$ and $(U_{\alpha}, u_{\alpha})$ be a chart such that $x \in U_{\alpha}$, and $(U_{\alpha}, \psi_{\alpha})$ be the T-chart corresponding to it. In this case we define the mapping $\varphi_x : E_x \to \bigoplus_{i=1}^{b} T^i_x M$ by

$$
\varphi_x(\xi) := \sum_{i=1}^{n} y_{\alpha}^i \left( \frac{\partial}{\partial u_{\alpha}^j} \right)_{x} \oplus L
$$

(17)

$$
\bigoplus_{i=1}^{n} y_{\alpha + n + i}^{(b-1)n + i} \left( \frac{\partial b}{\partial u_{\alpha}^j} \right)_{x} \oplus L
$$

L \oplus \bigoplus_{i=1}^{n} y_{\alpha + n + i}^{(b-1)n + i} \left( \frac{\partial b}{\partial u_{\alpha}^j} \right)_{x}
$$

where $\xi_x \in E_x$ and $\xi_x = \sum_{i=1}^{b} y_i \psi_{\alpha}^{-1}(x, e_i)$. That we assume $\{e_i, K, e_k\}$ is the standard bases for $R^k$, also for any $f \in C^\infty(M, R)$ we define

$$
\left( \frac{\partial f}{\partial u_{\alpha}^j} \right)_{x} := \left( \frac{\partial f}{\partial u_{\alpha}^j} \right)_{x}
$$

(18)

3.4. Lemma

$\varphi_x(\xi)$ is well defined.

Proof: It is sufficient to show the definition is independent of charts. Let $(U_{\alpha}, u_{\alpha})$ and

$$
\xi_x = \sum_{i=1}^{b} y_i \psi_{\alpha}^{-1}(x, e_i)
$$

(19)

Therefore, we have

$$
\varphi_x(\xi) = \varphi_x \left( \sum_{i=1}^{b} y_i \psi_{\alpha}^{-1}(x, e_i) \right)
$$

$$
= \sum_{i=1}^{n} y_{\alpha}^i \left( \frac{\partial}{\partial u_{\alpha}^j} \right)_{x} \oplus L \oplus \bigoplus_{i=1}^{n} y_{\alpha + n + i}^{(b-1)n + i} \left( \frac{\partial b}{\partial u_{\alpha}^j} \right)_{x} \oplus L
$$

$$
L \oplus \bigoplus_{i=1}^{n} y_{\alpha + n + i}^{(b-1)n + i} \left( \frac{\partial b}{\partial u_{\alpha}^j} \right)_{x}
$$

(20)

$$
= \sum_{i=1}^{n} y_{\alpha}^i \left( \frac{\partial u_{\alpha}^j}{\partial u_{\alpha}^j} \right)_{x} \left( \frac{\partial}{\partial u_{\alpha}^j} \right)_{x} \oplus L
$$

$$
= \sum_{i=1}^{n} y_{\alpha}^i \left( \frac{\partial u_{\alpha}^j}{\partial u_{\alpha}^j} \right)_{x} \left( \frac{\partial}{\partial u_{\alpha}^j} \right)_{x} \oplus L
$$

By using (3.6), we have
\[ = \sum_{i=1}^{n} z_i \left( \frac{\partial}{\partial u_{b_i}} \right) \oplus \mathbb{L} \oplus \sum_{i=1}^{n} z_{m+i} \left( \frac{\partial}{\partial u_{b_i}} \right) \oplus \mathbb{L} \]
\[ \oplus \sum_{i=1}^{n} z_{(b-1)n+i} \left( \frac{\partial}{\partial u_{b_i}} \right) \varphi_x (\xi_x) \]

Therefore, \( \varphi_x \) is well define.

3.5. Theorem
Let \((E, p, M)\) be a T-bundle such that for any \(x \in M\), \(\dim(p^{-1}(x)) = b\) then the mapping \(\varphi : E \to \bigoplus_{i=1}^{\infty} T^i M\) with \(\varphi(\xi_x) := \varphi_x (\xi_x)\) is an isomorphism of T-bundles.

**Proof:** Let \((U, u)\) be a chart on \(M\) and \(\varphi_x \) be the correspondence T-chart on \(E\). It is clear that \(\varphi\) is invertible and by using the proof of theorem (3.2) the following diagram is commutative:

\[
\begin{array}{ccc}
\pi^{-1}(U) & \xrightarrow{\varphi} & \pi^{-1}(U) \\
\downarrow{\psi} & & \downarrow{\psi_f} \\
U \times \mathbb{R}^b & \xrightarrow{\Phi} & U \times \mathbb{R}^k
\end{array}
\]

Where \(\varphi(x, \alpha) = (x, \alpha)\) that is isomorphism for any \(x\).

3.6. Corollary
Any two T-bundles on the same base such that their fibers have the same dimension are isomorphic.

3.7. Definition
Suppose \((E, p, M)\) be a T-bundle. By a section of the T-bundle \(E\) we mean an smooth map \(\xi : M \to E\) such that \(p \circ \xi = \text{Id}_M\).

We denote the set of all sections of a T-bundle \((E, p, M)\) by \(C^\infty(E)\).

3.8. Definition
Let \((E, p, M)\) be a T-bundle; \(\xi, \eta \in C^\infty(E)\) and \(f \in C^\infty(M, R)\) then we define:

\[(\xi + \eta)_x := \xi_x + \eta_x, \quad (f \xi)_x := f(x) \xi_x \]

3.9. Definition
Let \(\xi\) and \(\eta\) be in \(C^\infty(E)\) and \((U\alpha, u\alpha)\) be a chart on \(M\), in this case we can write in local coordinates

\[\xi | U\alpha = \sum_{i=1}^{k} f_i \psi^{-1}_\alpha (., e_i) \quad \text{and} \]
\[\eta | U\alpha = \sum_{i=1}^{k} g_i \psi^{-1}_\alpha (., e_i) \]

where \(f_i, g_i \in C^\infty(U\alpha, R)\). Then we define

\[\xi \eta := \varphi^{-1} (\varphi(\xi) \varphi(\eta)) \]

3.10. Definition
Let \(\xi\) be a section of T-bundle \((E, p, M)\), suppose that \(x \in M\) and \((U\alpha, u\alpha)\) is a chart of \(M\) such that \(x \in U\alpha\).

Also we assume that \(f = (f_1, K, f_b) \in C^\infty(U\alpha, \mathbb{R}^b)\)

where \(f_i \in C^\infty(U\alpha, R)\), in this case we define

\[\xi : C^\infty(U\alpha, \mathbb{R}^b) \to C^\infty(U\alpha, \mathbb{R}^b) \]

by

\[\xi(f)(x) = (\varphi(\xi)(f_1, L, f_b))(x)\]

\[:= \left( \sum_{i=1}^{n} g_i (x) \frac{\partial f_i}{\partial u_i}(x), L, \sum_{i=1}^{n} g_{(b-1)n+i} (x) \frac{\partial f_b}{\partial u_i}(x) \right) \]

where \(\xi \big| U\alpha = \sum_{i=1}^{k} g_i \psi^{-1}_\alpha (., e_i)\).

Now we can define the Lie bracket of to sections of a T-bundle.

3.11. Definition
Let \(\xi, \eta \in C^\infty(E)\), then we define the Lie bracket of \(\xi\) and \(\eta\) by \([\xi, \eta] = \xi \eta - \eta \xi\), if we assume that

\[\xi | U\alpha = \sum_{i=1}^{k} f_i \psi^{-1}_\alpha (., e_i)\quad \text{and} \quad \eta | U\alpha = \sum_{i=1}^{k} g_i \psi^{-1}_\alpha (., e_i)\]

then we have
\[[\xi, \eta] U_a \supseteq \sum_{p=0}^{b-1} \sum_{i=1}^n \sum_{j=1}^n f_{p,n+j} \frac{\partial g_{p,n+i}}{\partial u_a} - g_{p,n+j} \frac{\partial f_{p,n+i}}{\partial u_a}\psi^{-1}_a (., e_{p,n+i})\]

\[\text{(29)}\]

3.12. Theorem

Suppose that \((E, p, M)\) is a T-bundle then \(\mathcal{C}^\infty (E)\) with Lie bracket and the addition of functions and scaler product is a Lie algebra. \(\text{Proof:}\) The product that we define in definition (3.9) is associative (It is clear from the definition) so \(\mathcal{C}^\infty (E)\) is an associative algebra and also we define the Lie bracket of two sections \(\xi\) and \(\eta\) by \(\xi \eta - \eta \xi\), therefore the \(\mathcal{C}^\infty (E)\) is a Lie algebra.

3.13. Corollary

If \((E, p, M)\) be a T-bundle with standard fiber \(R^k\) such that \(\text{dim}(M) = n\) then the Lie algebra \(\mathcal{C}^\infty (E)\) is isomorphic to multiplication of \(b = k / n\) copies of Lie algebra \(\chi (M)\) (the Lie algebra of all vector fields on \(M\)).

4. Conclusion

T-bundle which defined in this article is a vector bundle such that it is a natural generalization of tangent bundle. Also we defined a Lie algebra structure on the set of smooth sections of a T-bundle such that in particular case of tangent bundle it coincides with the Lie algebra of vector fields.
